## Description

*Elderly Magicians* doesn't necessarily require you to begin with an arbitrary character, so that you can play it in an MMO style! On the battle field, the damage you can do has much more weight to it than the life points you have. You have to choose a game plan that suits you to survive, now it's time for the adventure! Explore a world where magic transmutation and elemental attack actions aren't bound by time, like you were free to develop your play style and approach to each situation freely. The first expansion, "Twilight Abyss," released on the 24th of October will include all the content of the game included in the first edition of the complete edition.

Q: Login modules and requirement We are revising our current login architecture and I was hoping someone could give me a clear explanation about when you would use a LoginModule and when you wouldn't. Our current J2EE application uses a simple username/password and displays a welcome screen. The app makes no modifications to the user and the user has to log in every time they want to do anything. I'm not even sure if this needs to be a logon screen or not. I'm pretty sure that if the user was just clicking a button to start work, we would not call the login screen. Anyway, does this require a LoginModule?

A: You would call the Login Module if the user will need to have a userid/password to do something, which is either modifying, or receiving data from your application. If you have an option where the user can pick their username/password on your site when they sign up then I would say you do not need a Login Module. However, if you are going to require the user to login to access this data or modify it then a Login Module is the way to go.
