The Framingham Study provides new information about coronary heart disease incidence and the contribution of several cardiovascular risk factors. In the Framingham study, incidence of myocardial infarction (MI) in women was higher than in men and strongly correlated with the incidence of the disease in women in the three clinical centers of the study. The new incidence rates were estimated taking into account data on the cumulative incidence and the relative risk obtained in men. In the whole population the contribution of smoking to the incidence of MI was 50% in men and 42% in women and
