GeekDOS is a DOS based Operating System that seems so 1990. It was originally developed in 1993 for use on a 6.2 mhz 386 computer, and its objective is to give old computers, or computers that are not fast enough, access to many of the DOS based applications that the newer ones have, all for free. The base operating system is FreeDOS. This was the operating system that the original DOS was based on, and

---

thus is the ancestor to all other DOS based operating systems. Install: GeekDOS is available as a floppy, consisting of the standard freeDOS based operating system, all of the new geekDOS based apps, and a copy of the DOS navigator, a GUI program that makes it easy to navigate between files. Installation is very easy; simply burn the.iso file to the CD, load the CD into the computer, and follow the onscreen instructions. For those that prefer to use a floppy, you simply place the floppy image,

---

unzipped, into the floppy directory. Dos 7.1: GeekDOS uses DOS 7.1 as its default. This is the DOS version that was popular with many old computers, but it does not work on a large number of older computers because they do not support the large number of commands and options that newer computers do. DOS 6.2: GeekDOS 7.2 builds on DOS 7.1. It is the version of DOS that is largely compatible with most old computers. DOS 5.1: GeekDOS 8.1 builds on DOS 6.2. It is the

---

version of DOS that will work with the great majority of older computers, even if they are not set up to use DOS 6.2. DOS 4.2: GeekDOS 9.1 is based on DOS 5.1. It is the latest version of DOS that will work on older, simpler computers. DOS 3.3: GeekDOS 10.1 is based on DOS 5.1. It is the latest version of DOS that will work on most computers. DOS 3.2: GeekDOS 11.1 is the latest version of DOS that will work on all computers. Alternate Description: GeekDOS is like a modern version of DOS, but

---

with a much easier learning curve. This is intended for those that wish to experience DOS, as it was before all

GeekDOS is a free Linux-based operating system, which runs on the PowerPC and the Intel x86 architectures. It is based on DOS, but without the disk memory limitations. DOS programs won't run directly, unless you disassemble them. GeekDOS main focus is to run MS-DOS compatible games,

---

without the hassle of patching and hardware changes. As a bonus, GeekDOS makes all your MS-DOS applications work too, so you can look up files or print a document, all without rebooting. Below is a list of the primary features: -

- compatibility with MS-DOS -
- GUI-based file manager -
- Recycle Bin (receives files from your hard disk, like DOS does) -
- Multi-homed connections -
- Internet support -
- MS-DOS compatible games -
- Run MS-DOS applications

GeekDOS is a FreeDOS based operating system, designed to be relatively easy to use and fit on a single floppy. It includes the DOS Navigator that lets you browse for and run the various files included on your floppy. The included GUI uses themes and skins, allowing you to choose the look of the OS you wish to use. All the files required to load, and run the software are included in the OS image. By default the OS loads and runs using default settings.

---

You can change these, or implement custom settings to meet your own requirements. Please note that these are just example buttons. To create your own buttons in the GUI, you will need a bit of help and there's a good tutorial available here:

Freedos\_GeekDOS Version Info:  
Notice there is no 7.10.98 or 7.10.99 version because I tried to include all the features I could find from those versions. The only feature missing from these days is the Floppy drive speed (which I have excluded),

---

so not many new features have been added. There is a new feature, the "Open files from disk" script that starts up the OS with each disk mounted and there files already loaded. This makes it easy to start using the Disk select feature of the GUI without having to select and mount each disk. An example of this can be seen on the OS tour screen here: This means I can't run a separate update process to add new features, the OS doesn't load properly if there aren't all the files on the floppy (8 floppy disks). I have

---

also added new options to the "File associations" menu in the menu-bar. More information is available here:

Freedos\_GeekDOS Download:  
The actual version of GeekDOS I am including is 0.78.19. There is a version of GeekDOS here: (dated 03/12/02), but this is actually the version 0.80.0. There is also an older version of GeekDOS here:

#### **What's New In GeekDOS?**

GeekDOS is a small OS on a single 64kb floppy or CD. With

---

it, you can enjoy classic MS-DOS applications like games, system tools, business tools, or whatever. You can download DOS-Box (or any other DOS emulator) by searching in Google. Some great games to run on this system are: If you are thinking of making the switch, and want to run DOS games, the best thing to do is learn Crossover. It's free for one year, and is optimized for DOS games. But really, it works for just about anything. GeekDOS Retro: Here's a video (I think this is my first one): A:

To add a different note, some people already solved a similar problem by using "aPPSwitcher". As written in the project's website: "AiPPSwitcher was created to enable easy emulator switching for I/O-Software. It does so by implementing the PSWITCH command /PS-command. AiPPSwitcher allows for switching easily between different DOS-Emulators. Examples: "simulator1" - Simulates the old DOS-Emulator DOS1. "simulator2" - Simulates the old DOS-

Emulator DOS2. Note: For usage of this software, you also need to have DOS1 or DOS2 installed on your computer. A: I always recommend MAXQ; the GUI version is free, and the command-line version is free as well.
