We read the article "Biological and Molecular Characteristics of Phenoxidizing Bacteria in the Brazilian Oyster *Crassostrea brasiliensis*" by Pazuch et al. \[[@B1-microorganisms-08-00176]\] with great interest. The authors provided a unique research on a very important subject, adding an important contribution in the study of the role of biofilm formation in the marine environment. At the end of the article, the authors provided their conclusions, in which they stated that the presence of bacterial phenoxidizing microorganisms in the digestive gland was in accordance with the great capacity of this organ to perform very complex chemical reactions. However, they did not mention the presence of bacterial phenoxidizing microorganisms in the gills, including the shell, even though the authors only analyzed the presence of bacterial community and not the individual phenoxidizing microorganisms. Despite, the diverse biochemical characteristics of bacteria that metabolize aromatic compounds, such as phenol, the authors mentioned that the gills did not metabolize phenol, pointing out that microorganisms present in the marine environment have many different roles, such as prey consumption. In this way, they highlighted the role of the gills as host of microbial communities, being the most important organs of a physiological, behavioral, and ecological role \[[@B2-microorganisms-08-00176]\]. Although the authors did not find phenoxidizing microorganisms in the gills or shell, they did find the beta-proteobacteria *Loktanella* sp. and *Thalassomonas* sp. ([Figure 1](#microorganisms-08-00176-f001){ref-type="fig"}) in the digestive gland. *Loktanella* is a genus of aerobic and gram-negative bacteria considered part of the Vibronaceae family. Different members of this genus have been described in the marine environment with a capacity to produce phenol and/or dimethylsulfide (DMS). In fact, *Loktanella* spp. have been isolated from seabed sediments, marine fishes and seaweeds. Studies have shown that *Loktanella* can use phenol and benzoate as substrates for their growth. Moreover, in the presence of bicarbonate, *Loktanella* can metabolize the aromatic compounds present in crude oil as sol

The Brush Tip Shape dialog box allows you to adjust the size and size of brush tip. This is helpful when tracing some of the very fine lines that are present in art. Multiple strokes can be created from one type of brush, allowing for faster photo editing. The Brush Preview window shows you the brush you are using, and the angles from which it can be used. The Pen Tool allows you to draw fine lines and shapes. After you draw lines and shapes, you can select them and move them around using the Selection or Select tools. The Eraser Tool makes lines and shapes disappear. When you use the Selection tool, you can select a part of an image and then use it to resize an object, move it, or crop the image. The Pen Tool makes it easier to draw lines and shapes. The Blend Modes feature allows you to make an image blend with another image. For example, you can make smooth transitions between two different shades of colors, like making one shadow lighter than the next. The Spot Healing Brush tool has two modes: Quick Fix and Content Aware. The Quick Fix mode can fix small scratches, repair tears in the corner of your image, or make small corrections. The Content Aware mode can detect changes in colors in your image and then change those colors to other colors that blend with the surrounding pixels. The Healing Brush tool fixes scratches and other imperfections in an image. It can restore parts of your image that have been damaged or removed. The tool's Job History feature lets you see where on your image you're fixing small holes and scratches. Saving space in your image can be a real challenge. The Blur tool makes objects in an image seem blurred or even transparent. For example, you can blur the background of your photo to make your subject appear in focus. The Saturation tool makes colors in an image appear brighter or greener, depending on your settings. You can adjust the intensity of colors by playing with the Saturation slider, which lets you choose between the tool's Light, Normal, and Dark settings. The Dodge and Burn tools brighten or darken a part of an image. You can control the intensity of these tools by using the Dodge or Burn sliders. These tools let you make your images brighter or darker by setting the sliders to the left or right. This part of the Photoshop program is designed to work with other programs. You can open a JPEG, GIF, or TIFF image in Photoshop and work with it as a set
